

## JDBC AND COLLECTIONS

1. Airline reservation systems require databases to store, organize, and process data about flights and customers. These databases hold essential information such as flight schedules, seat availability, ticketing information, travellers' data, and booking details. Write a program to create, insert, delete, update and display records of the databases.
2. Write a program to create and implement various operations of stack.
3. Write a program to show working of user-defined Generic classes.
