Banking Application

Project Objective:

Create a console based Java application that would allow the customer of a bank to perform day to day bank transactions. The following are the tasks that need to be performed by the Customer.

- 1. View balance.
- 2. Transfer amount.

Overview:

View balance: If the account number is given the balance should be returned

Transfer Amount: This function is used to transfer money from one account to another account.

For the operation to be successful, the following conditions are to be met.

- 1. Both the account numbers should be valid
- 2. The account number from where the money is transferred should have enough money for performing the transfer operation

If all these conditions are met, the given amount has to be debited from the payer and credited to the beneficiary (account_tbl) and an entry has to be made in the transfer_tbl

A. Database Design:

- 1. Create a new user in database [To be done in the backend by using sql commands]
 - a) <u>Note</u>: Do **NOT** use the default scott/tiger account of oracle for this project. You will have to create a new user in the below mentioned format.
 - b) Username/password : B<batchnumber><employeeid>
 For example, if your batch number is **39806** and Employee number is **12345**, then the oracle user should be **B3980612345** and the password should be **B3980612345**
 - c) For JDBC connection, only use **XE** as service name and **1521** as port number

2. Steps for creating a new user

- a) Open command prompt
- b) Sqlplus / as sysdba
- c) Create user <username> identified by <password>; [For example to create a user named"test" with password "test" : create user test identified by test;]
- d) Grant connect, resource to <username>; [E.g: grant connect, resource to test;]
- e) Commit;
- f) Exit;
- 3. Create Table [To be done using sql commands, after logging-in as the new user that has been created in above step]

Table Name: ACCOUNT_TBL

Values for this table will be hardcoded directly.

Column	Datatype	Description
Account_Number	Varchar2(10)	Primary Key.
Customer_Name	Varchar2(15)	Account holder name.
Balance	Number(10,2)	Account Balance

Insert some records into the Account_TBL

Sample Records

ACCOUNT_NUMBER	CUSTOMER_NAME	BALANCE
1224567900	Boddy	 00000
1234507690	Mahash	00000
1234507691	Dhanu	100
1234507692	Dilaliu	100
1234507893	Sdill	500

Table Name: TRANSFER_TBL

Column	Datatype	Description
Transaction_ID	Number(4)	Primary Key
Account_Number	Varchar2(10)	Foreign Key, this field
		references Account_Number
		field of Account_tbl.
Beneficiary_account_number	Varchar2(10)	Foreign Key, this field
		references Account_Number
		field of Account_tbl.
Transaction_Date	Date	Date of transaction.
Transaction_Amount	Number(10,2)	Amount to be transferred.

4. Create Sequence:

Sequence Name : transactionId_seq

Sequence Name	Minimum Value	Max Values	Incremental value	Start Value
transactionId_seq	1000	9999	1	1000

B. System Design:

Name of the backage Usage	ame of the package	Usage

com.wipro.bank.service	This package will contains the class which displays the console menu and takes the user input. It contains the methods that performs validation on the given input and invokes the respective DAO operations
com.wipro.bank.bean	This package will contain the entity class named TransferBean.
com.wipro.bank.dao	This package will contain the class that will do the database related JDBC code.
com.wipro.bank.util	This package will contain the class to establish database connection and also the class that handles the user defined exception.

Package: com.wipro.bank.util

Class	Method and Variables	Description
DBUtil		DB connection class
	public static	Establish a connection to the
	Connection getDBConnection()	database and return the
		java.sql.Connection reference
InsufficientFundsException		User defined exception class
	public String toString	Returns a String "INSUFFICIENT FUNDS" .The details about when it has to be thrown is given in the appropriate methods

Package: com.wipro.bank.bean

Class	Method and Variables	Description
TransferBean		Class
	private int transactionID	Transaction Id
	private String	AccountNumber from where money is
	fromAccountNumber	going to be transferred
		*Maps to Account_Number field of
		Transfer_tbl
	private String toAccountNumber	AccountNumber to where money is
		going to be transferred
		*Maps to
		Beneficiary_account_number field of
		Transfer_tbl
	private Date dateOfTransaction	Date on which transaction is taking
		place-current Date [java.util.Date]
	private float amount	Amount to be transferred
	setters & getters	Should create the getter and setter
		methods for all the attributes

	mentioned in the class

Package: com.wipro.bank.dao

Class	Method and Variables	Description
BankDAO		DAO class
	public int generateSequenceNumber()	 This method generates 4 digit auto generated number using transactionId_seq sequence
	public boolean validateAccount(String accountNumber)	 Check account_tbl and return true if account number is valid, else return false.
	public float findBalance(String accountNumber)	 Check account_tbl and return balance if accountNumber is valid else return -1
	public boolean transferMoney(TransferBean transferBean)	 Insert the transferBean values into the transfer_tbl. The transactionID is the value got from generateSequnceNumber The transaction date is today's date On successful insertion return true else return false
	public boolean updateBalance(String accountNumber, float newBalance)	 Update account_tbl with the newBalance for the given accountNumber Return true for successful updation and false if not

Package: com.wipro.bank.service

Class	Method and Variables	Description
BankMain		Main class
	public static void main (String[] args)	
	The code that is needed to test your program	goes here. A sample code is shown at the
	end of the document.	
	public String checkBalance(String accountNum	nber)
	Steps to perform:	
	Invoke appropriate BankDAO methods and p	erform the following:
	 Validate the accountNumber 	
	2. If valid, find the Balance for the given	accountNumber
	3. Return message in given format	

For eg) If the balance returned by findBalance method is 10000 then the return
value is
BALANCE IS:10000.0
4. If AccountNumber is invalid
return the following message
ACCOUNT NUMBER INVALID
public String transfer(TransferBean transferBean)
Steps to perform:
Invoke appropriate BankDAO methods and perform the following:
 If transferBean is null the function should return "INVALID"
2. Validate both the accountnumbers in the transferbean. In case if any of the
accountNumbers are invalid the function should
return INVALID ACCOUNT
3. If both the numbers are valid, check if the fromAccountNumber has
sufficientfunds to transfer
4. The function will throw "InsufficientFundsException" if the payer does not
have sufficient money. The exception will be caught in the same method itself.
If exception is caught the function should return "INSUFFICIENT FUNDS"
[Note: Do not use System.exit(0) while handling exception]
5. If the Payer has enough money, update account_tbl for both the account
numbers to perform the transfer operation (reduce the given amount from
fromAccountNumber and add the given amount into toAccountNumber] and
invoke the transferMoney function of the BankDAO class to include the
transaction detail in the transfer_tbl
If step5 was successful, the method would return "SUCCESS".

Main Method:

You can write code in the main method and test all the above test cases. A sample code of the main method to test the first test case is shown below for your reference.

public static void main(String[] args) {

// View Balance
System.out.println(bankMain.checkBalance("1234567890"));

// TransferMoney
TransferBean transferBean = new TransferBean();

transferBean.setFromAccountNumber("1234567890"); transferBean.setAmount(500); transferBean.setToAccountNumber("1234567891"); transferBean.setDateOfTransaction(new java.util.Date()); System.out.println(bankMain.transfer(transferBean));
}

Test Cases:

Below is the actual set of test cases that the CPC test engine will run in the background. Please ensure that the conditions mentioned in these test-cases are handled by your class design.

- 1. Test for SequenceNumber Creation
- 2. Test for Balance checking with valid account number
- 3. Test for Balance checking with invalid account numnber
- 4. Test for successful transfer of funds
- 5. Test for transfer with low funds
- 6. Test for transfer with zero balance
- 7. Test for transfer with invalid payer account number
- 8. Test for transfer with invalid beneficiary account number
