

STRING & DATE AND TIME API

SPOT

You are building a **Log Analyzer** for a server. Each log entry is a string in the format:

```
"[2025-07-28 14:30:00] - User 'john_doe' logged in"
```

Write a program that:

1. Parses a list of such log entries.
2. Extracts the **timestamp** and **username** from each entry.
3. Counts how many users logged in during **business hours** (9:00 AM to 6:00 PM).
4. Finds the **earliest** and **latest** login time.
